In recent years, Southern states have been inundated by major flooding events. According to the National Oceanic and Atmospheric Administration (NOAA), annual flood records are expected to be broken again in 2020 and beyond. Taken together, these repeated flood events can create a significant and long-term strain on states’ economies, both in terms of tangible losses and damages, as well as lost productivity. This SLC Regional Resource [2] reviews recent flooding data in Southern states and explores how the Netherlands’ model of “living with water” may help states strengthen their resilience while reducing the cost of recovery for future flood-related disasters.

The Netherlands Model: Flood Resilience in Southern States
